## Part I. Traditional III-V Semiconductor Heterojunctions

|                                                                                                                                                  |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Modelling and characterizations of real interfaces in III-V heterostructures                                                                     | 1   |
| <i>C. Lamberti and E. Groppo</i>                                                                                                                 |     |
| 1. Introduction                                                                                                                                  | 1   |
| 2. Band profile calculations in strained heterostructures                                                                                        | 2   |
| 3. The undesirable strained interfacial layers                                                                                                   | 15  |
| Electronic properties of III-V semiconductor heterostructures                                                                                    | 37  |
| <i>Ikai Lo, Jenn-Kai Tsai, Li-Wei Tu and Jih-Chen Chiang</i>                                                                                     |     |
| 1. Introduction                                                                                                                                  | 37  |
| 2. 2DEG in semiconductor heterostructures                                                                                                        | 38  |
| 3. GaAs-based heterostructures                                                                                                                   | 43  |
| 4. InGaAs-based heterostructures                                                                                                                 | 45  |
| 5. GaN-based heterostructures                                                                                                                    | 51  |
| Sulfur passivation of III-V semiconductor surfaces                                                                                               | 57  |
| <i>A. B. M. O. Islam and C. Tatsuyama</i>                                                                                                        |     |
| 1. Introduction                                                                                                                                  | 58  |
| 2. Passivation techniques of III-V semiconductors                                                                                                | 58  |
| 3. Structural model of S-passivated surfaces                                                                                                     | 64  |
| 4. Bonding states of S atoms and substrate surfaces                                                                                              | 69  |
| 5. Electronic properties of S-passivated surfaces                                                                                                | 71  |
| 6. Enhancement of PL properties by S passivation                                                                                                 | 74  |
| 7. Conclusions                                                                                                                                   | 76  |
| The use of EXAFS spectroscopy and related techniques in the characterization of III-V thin films heterostructures                                | 79  |
| <i>C. Lamberti</i>                                                                                                                               |     |
| 1. Basic concepts of EXAFS spectroscopy                                                                                                          | 80  |
| 2. Pioneering EXAFS studies of bulk semiconductors                                                                                               | 83  |
| 3. Use of EXAFS on SLs and thin films: Effect of strain                                                                                          | 85  |
| 4. Joint role of alloying and epitaxy in determining the first-shell bond distances in strained $\text{In}_x\text{Ga}_{1-x}\text{As}/\text{InP}$ | 89  |
| 5. Higher shell EXAFS analysis: A multiple-scattering approach                                                                                   | 94  |
| 6. EXAFS studies of interface mixing in InGaAs/InP short-period SLs                                                                              | 100 |
| 7. Related techniques                                                                                                                            | 102 |

|                                                                             |     |
|-----------------------------------------------------------------------------|-----|
| Metamorphic InAlAs/InGaAs HEMTs: Material properties and device performance | 111 |
| <i>Y. Cordier, S. Bollaert, M. Zaknoute, J.M. Chauveau and A. Cappy</i>     |     |
| 1. Introduction                                                             | 111 |
| 2. InAlAs/InGaAs heterojunctions                                            | 113 |
| 3. Growth process                                                           | 117 |
| 4. Electron transport and charge control in metamorphic HEMTs               | 123 |
| 5. Device performance                                                       | 128 |
| 6. Conclusions                                                              | 132 |

## Part II. Antimonides for Infrared Applications

|                                                                      |     |
|----------------------------------------------------------------------|-----|
| InAs/InAsSb emitters for the mid-infrared region                     | 139 |
| <i>J. D. Heber and C. C. Phillips</i>                                |     |
| 1. Introduction                                                      | 140 |
| 2. Experimental details                                              | 141 |
| 3. Theoretical model                                                 | 143 |
| 4. Optical studies                                                   | 144 |
| 5. Magneto-optical studies                                           | 156 |
| 6. Conclusions                                                       | 165 |
| Sb-based nanostructures for mid-IR optoelectronics                   | 169 |
| <i>A.A. Toropov, O.G. Lublinskaya, V.A. Solov'ev and S.V. Ivanov</i> |     |
| 1. Introduction                                                      | 170 |
| 2. Antimonide-based quantum well heterostructures                    | 171 |
| 3. Antimonide-based quantum dot nanostructures                       | 182 |
| 4. Acknowledgements                                                  | 196 |

## Part III. Group III-nitrides and Alloys

|                                                                                                                         |     |
|-------------------------------------------------------------------------------------------------------------------------|-----|
| Epitaxial growth of group III-nitride semiconductors                                                                    | 201 |
| <i>S. Yamaguchi, H. Amano and I. Akasaki</i>                                                                            |     |
| 1. Introduction                                                                                                         | 201 |
| 2. Growth and characterizations of III-nitrides                                                                         | 202 |
| 3. Appendix: Stress-strain relation                                                                                     | 220 |
| 4. Conclusions                                                                                                          | 222 |
| GaNAs: Growth and characterization                                                                                      | 229 |
| <i>Z. Pan</i>                                                                                                           |     |
| 1. Introduction                                                                                                         | 230 |
| 2. Experimental procedure                                                                                               | 231 |
| 3. Growth and kinetic modeling                                                                                          | 232 |
| 4. Thermal annealing                                                                                                    | 236 |
| 5. Optical properties of GaInNAs/GaAs QWs                                                                               | 240 |
| 6. Conclusions                                                                                                          | 247 |
| MOVPE growth, phonons, band-to-band transitions and dielectric functions of InGaAs/GaAs superlattices and quantum wells | 251 |
| <i>G. Leibiger, V. Gottschalch, G. Benndorf, J. Šik and M. Schubert</i>                                                 |     |
| Introduction                                                                                                            | 252 |

|                                                        |     |
